

Supercharged One-step Text-to-Image Diffusion Models with Negative Prompts

One-Step Models are fast but lack negative guidance

- The Gap: One-step models cannot remove unwanted features using negative prompts.
- The Flaw: Classifier-Free Guidance (CFG), is built for multi-step models and fails in one step, corrupting the image.

For the first time 🧳 Negative guidance in One/Few-Step Models 🧳

Contributions

- 1. First negative guidance for one-step and few-steps models, solving a critical control limitation in real-time generation.
- 2.New State-of-the-Art with a record HPSv2 score of 31.21
- 3.Minimal Overhead Only ~1.9% FLOPs vs. ~100% for CFG.
- 4. Generalizability across images (PixArt-a, **FLUX**) and video (CausVid) generation.

- 1. Inference (NASA-I): Apply to any pre-trained model for immediate negative prompt control.
- 2. Training (NASA-T): Integrate into distillation to train student models with native control, achieving SOTA results.

New one-step SOTA (HPSv2 31.21)

| + NASA-T + NASA-I | 0.35 | 0.05 | <u>32.65</u> | <u>29.65</u> | 31.45 | 31.06 | 31.21 (+0.87) |

(A) On the **NegOpt** benchmark (30k prompt pairs). CLIP+/- measures positive/negative prompt alignment.

| Method | FLUX.1 | -schnell | SDXL- | LCM | SDXL- | DMD2 |
|-----------|---------|----------|---------|------------|---------|--------|
| 1/10/1100 | 4 steps | 1 step | 4 steps | 1 step | 4 steps | 1 step |
| None | 23% | 44% | 43% | - | 27% | 25% |
| CFG | 30% | 0% | 14% | - | 25% | 0% |
| NASA-I | 100% | 99% | 97% | - | 100% | 100% |

(B) NASA-I achieves 97-100% success in removing unwanted features where CFG fails in few- & one-step models.

| Method | VBench-Long benchmark | | | | |
|--------|-----------------------|-------------------|--|--|--|
| | Aesthetic Quality ↑ | Imaging Quality ↑ | | | |
| None | 61.98 | 67.12 | | | |
| NASA-I | 63.33 | 67.36 | | | |

(C) Applied to the CausVid video model, NASA-I improves both aesthetic and imaging quality.
